'Stunning Admission': Widely Used HPV Vaccine Linked to 4 Autoimmune Disorders

A study comparing nearly a million vaccinated and unvaccinated adolescent girls over seven years found the girls vaccinated with quadrivalent HPV vaccine were 4.4 times more likely than their unvaccinated counterparts to develop rheumatoid arthritis.

A type of human papillomavirus (HPV) vaccine widely used throughout the world, but not in the U.S., may increase the risk of developing four autoimmune disorders, according to a study published last week in Vaccine.

The Colombian retrospective cohort study compared the health records of nearly 2 million vaccinated and unvaccinated adolescent girls over 10 years and found the girls vaccinated with a quadrivalent HPV vaccine were 4.4 times more likely than their unvaccinated counterparts to develop rheumatoid arthritis.

Quadrivalent HPV vaccines target four high-risk strains of HPV, compared with Merck's Gardasil 9 vaccine, the only HPV vaccine distributed in the U.S., which targets nine strains.

Merck does make a quadrivalent Gardasil vaccine — one of two quadrivalent vaccines licensed by the World Health Organization. The study did not specify the brand of vaccine administered.

The girls in the Colombian study also were 2.76 times more likely to develop juvenile idiopathic arthritis, 2.86 times more likely to develop thrombocytosis and 2.54 times more likely to develop idiopathic thrombocytopenic purpura during the 180- and 360-day post-vaccination follow-up period studied.

ORDER NOW

"There are significantly higher levels of these four autoimmune disorders — in girls who weren't diagnosed with the disorders before vaccination — in the vaccinated group," Brian Hooker, Ph.D., chief scientific officer for Children's Health Defense (CHD) told The Defender.

"This is a stunning admission of the immune dysregulation caused by this vaccine," Hooker said. "At a minimum, this deserves more comprehensive investigation towards a decision whether to pull the vaccine entirely."

The study adds to a large body of peer-reviewed literature from the U.S., Australia, Denmark and Sweden, France, Japan, and Colombia and statistics published by public health agencies in each of these countries demonstrating associations between HPV vaccination and autoimmune conditions.

HPV vaccination rates in Colombia are extremely low, the authors reported. This is in part because, in 2014, 500 girls in a small town in the Department de Bolivar reported adverse symptoms, including headache, paresthesia, shortness of breath, chest pain and fainting. Videos of the girls were widely shared on the internet.

As public confidence in the vaccine plummeted, rates went from 80% of girls in 2012 to 14% and 5% for the first and second doses in 2016. A later study classified the response as a "mass psychogenic response" unrelated to the content of the vaccine.

"There is strong scientific evidence mindset," the study's authors wrote, defining "the quadrivalent vaccine as "safe and effective." Despite this belief, there is a lack of local studies to support that evidence. With this study, they said they hoped to provide information on the safety profile of the vaccine.

Merck's quadrivalent Gardasil vaccine is the only quadrivalent vaccine licensed by the World Health Organization. The study did not specify the brand of vaccine administered.

As part of its commitment to catalyze national and global momentum "to eliminate cervical cancer," Colombia formed the first Global Cervical Cancer Elimination Forum earlier this month in Cartagena de Indias.

The Bill & Melinda Gates Foundation, UNICEF and the World Bank committed nearly $600 million to expand global vaccination, screening and treatment in multiple countries, including Colombia.

The results 'speak for themselves'

For their analysis, the researchers accessed national vaccination data and national health record data for adolescent girls ages 9-19 who had accessed the Colombian national healthcare system between 2012 and 2021 for 1 of 81 autoimmune, neurological and hematological diseases thought to be associated with the quadrivalent HPV vaccine and three diseases not thought to be related.

They selected 16 of the diseases most commonly associated with the HPV vaccine and used statistical analysis to determine if the girls were diagnosed with each of the diseases between the vaccinated and non-vaccinated cohorts at 180 and 360 days post-vaccination.

The researchers analyzed the results from the first and second doses of the HPV vaccine separately. For the first dose, they compared 55,114 vaccinated adolescent girls to 370,800 unvaccinated ones. For the second dose, they compared 35,801 vaccinated girls to 370,793 unvaccinated ones.

For six of the diseases, they found there were not enough cases present to estimate a causal effect. Those included Guillain-Barré syndrome, transverse myelitis, optic neuritis, myasthenia gravis, multiple sclerosis, and disseminated acute encephalitis.

That left them with data for 10 diseases, including rheumatoid arthritis, juvenile idiopathic arthritis, systemic lupus erythematosus, Behl's palsy, idiopathic thrombocytopenic purpura, thyrotoxicosis, Hashimoto's thyroiditis, hypothyroidism, other hypothyroidism and Type 1 diabetes.

Your support helps fund this work, and CHD's related litigation, education and scientific research.

DONATE NOW

They analyzed the causal relationship between the vaccines and those diseases over time, following the vaccinated subjects for an observational period of up to 2,000 days.

The study found significantly higher odds ratios for four of the diseases — rheumatoid arthritis, idiopathic arthritis, thyrotoxicosis and thrombocytopenic purpura — indicating that the vaccine played a role in the development of the diseases.

However, the researchers concluded that the temporal distribution of cases did not reveal a clear difference between the vaccinated and unvaccinated groups, because the rate of appearance of the new cases increased linearly for both groups — although they noted the number of cases was consistently higher in the vaccinated cohort.

They said their results should be interpreted with caution and called for further research.

Commenting on that conclusion, Hooker said, "It's odd yet not unpredictable that the authors point out no temporal association with the vaccination date as a way to *almost* dismiss the biological plausibility of the significant connection."

"However, without any type of biological mechanism of disease development in these patients, we simply don't know what such a temporal relationship with the vaccine would be," he added. "In other words, these significant odds ratios mean nothing at present."

This won't surprise anyone who knows that the human body only suffers diseases when it becomes toxic. They have never made a vaccine or pharmaceutical drug that does not add toxins to the body. Let this sink in. Every drug and every vaccine reduces the human body to experience ill health. They put do such a fantastic job at convincing the vast majority of people that we cannot live without their products to make us well. Is anyone smelling the coffee yet?

Exactly! I just told someone yesterday that given how 70% percent of all pharmaceuticals are derived from plant compounds, it's always best to do research and find the naturally occurring compound to use as medicine. There are a few rare instances when the natural compound isn't as effective but in most cases they are. There are really good medicine books like PDR for Herbal Medicine, The Herbal Drugstore, and Prescription Alternatives for Women and Children. I also have books on southern and Appalachian medicine and many more written by plant scientists and herbalists like Phyllis Light and Stephen Buhner. It's especially important to keep these book references if not digital on hand now in case one needs to treat a condition and doesn't want to put their life in danger by visiting a corrupt corporate doctor who prescribes poisons.
There also medicinal plant classes around the country- probably in your local area that teach how to identify and use medicinal plants. Utube also has many medicinal herbalists and botanists like these:

You could dump all the coffee in the world on everyone to vaccine research and they wouldn't smell it.

The HPV vaccines contain 4 or 9 "strains" of nothing. There is no proof of any HPV "virus". All those side effects are caused by the toxic soup that is injected into young girls and boys too. It is despicable that any parent would allow their child to be voluntarily poisoned! Everyone knows that it is safe up to the first unfortunately there's still a long way to go before it becomes even that.

Actually I'm just shocked/grateful that these girls SURVIVED this poison shot. Parents - WAKE UP and don't risk harming your son/daughter w/this vaccine!!

It has been proved by RFK, Jr i believe, that the incidence of developing cancer is significantly higher in the Gardasil vaccinated population. My perfectly healthy daughter ended up with rheumatoid arthritis from a vaccine. The corporations putting out these poisons are antithetical to healthy human development. Nothing but pure reckless evil.

It is criminal to push vaccines for HPV without warning the children and parents that HPV is a Sexually Transmitted Disease. How often are young girls (like the ten year olds who recently died from gardasil) at risk from getting an STD?
It seems too disturbing for people to think that girls have the right to say no to sexual contact that could lead to death. Girls and women have also been bullied into painful and dangerous cervical cancer screenings. Most cervical cancer is another STD and those who refuse sexual contact with boys and men are safe.

Please look at table 9 and 10 in this link: https://www.merck.com/pubs...
2.3 % of former young and healthy girls develope severe autoimmune disease after Gardasil (the quadrivalent) vaccination or injection of a product containing the aluminium adjuvant AAHS.
For the boys it is 1.5 %.

I would second this! The study is not mentioned by name, and any search of "Columbia"+"gardasil"+"Hooker" return no results.
Thanks!

The article stated that brand names like gardasil weren't referenced in the study, and Hooker certainly wouldn't be referenced. Here's the link which could be found by clicking on the first reference in the article. https://www.sciencedirect.c...

HPV - help pay for Vioxx, another of Merck's poisons. It's stunning they sell this garbage, moreover that people buy it.
